# The Late Bronze Age Crisis

abine Le Burel, Thierry Otto, Cecile Baeteman

Journal.pone.0071004

Mediterranean, a rich linkage of Aegean, Egyptian, Syro-Palestinian, and Hittite legacies and has remained one of the mysteries of the ancient world since the event's discovery. Iconic Egyptian bas-reliefs and graphic hieroglyphic and cuneiform texts portray the depictions of the "Peoples-of-the-Sea" at the Nile Delta, the Turkish coast, and down into the Levant. These peoples clashed, famine-ravaged cities abandoned, and countrysides depopulated. Here we present the Late Bronze Age crisis, alongside a radiocarbon-based chronology integrating dendrochronology, which reveal the effects of abrupt climate change-driven famine and causal linkage to the Late Bronze Age crisis. The statistical analysis of proximate and ultimate features of the sequential events, driven famine, sea-borne-invasion, region-wide warfare, and politico-economic changes, show how new ideologies were created.

Le Burel S, Otto T, Baeteman C (2013) Environmental Roots of the Late Bronze Age Crisis. *PLoS ONE* 8(8): e71004. <https://doi.org/10.1371/journal.pone.0071004>

The amplitude of Holocene climate fluctuations is less pronounced. Nevertheless, climate extremes on decadal to centennial scales and rapid shifts occurred during the Holocene [1]–[4], and significantly more extreme events have recently been shed by both paleoclimate [11]–[16] and archaeological evidence [20]–[21]. This event was also termed Late Bronze Age (LBA) collapse or crisis [20]–[21]. This event was ca. 1200 BC, with population migrations and wars. From this crisis arose new

civilizations in the Eastern Mediterranean. The Eastern Mediterranean hosted some of the world's most advanced civilizations. In the Bronze Age, the Eastern Mediterranean was home to powerful urban centres such as Mycenae and Tiryns in Argolis, Pylos in Messenia, Thebes in Boeotia, Iolkos in Thessaly, and Knossos in Crete [23]. The Hittites had their heartland in Anatolia, the north-western region of Syria, and extending eastward into Mesopotamia. In the Levant, Canaanite coastal cities were prospering through trade from Egypt to Mesopotamia, and the Egyptian and Hittite empires [25]. In Egypt, the New Kingdom was at its height during the 18th dynasty (1550–1296 cal yr BC; historical date 1295–1279 BC) and Ramses II (first regnal year 1279–1213 BC) [26]–[27]. However, around 1200 BC, at the end of the LBA, the Eastern Mediterranean experienced a crisis [20, 28–33]. Several not mutually exclusive causes were put forward to explain the crisis: natural events (tsunami, earthquake), technological innovations, internal collapses, and competition with states of inequality and the resulting political struggle between urban centres. Written sources from Ugarit (Syria) and Medinet Habou (Egypt) [32], [34], [40]–[42] show that the destruction of cities and states in motion was due to vast movements of seafaring and inland invasions. Archaeological correspondences between Levantine, Hittite, and Egyptian kings indicate that the crisis affected the coastal towns as well as great empires and vassal kingdoms [34].

Regarding the Sea Peoples, we still do not know exactly who they were, where they came from, and when they disappeared after their raids. Some scholars are even uncertain whether the Sea Peoples were the cause of the decline of the LBA. Recent studies [12], [22] have suggested that the Sea Peoples were the cause of the decline of the LBA.

complex spiral of decline in the Eastern Mediterranean world, and that this unstable mental causes operating over sizable areas. A climate shift, centred on the 13<sup>th</sup>–9<sup>th</sup> centuries on Eastern Mediterranean and West Asian environments where dry farming agriculture are the primary or secondary subsistence systems. Reduced precipitation probably drove rain-fed cereal agriculturalists to habitat-tracking when agro-innovations are not available, the enigmatic Sea Peoples were not a bunch of pirates merely in pursuit of the land, but constituted a set of ethnic entities fleeing inhospitable regions to conquer new lands, as noted in [22].

... in shaping ancient societies has emerged because a direct causation fails to be established. Linkages are proposed at a wide regional scale. An unequivocal spatial and temporal correlation, may offer a valuable case for emphasizing an ecological-climate influence

... at the heart of the ancient civilizations and trade routes of the Eastern Mediterranean. A palynological proxy based on a pollen record from Hala Sultan Tekke, Larnaca Salt Lake, details the eastern Cypriot coast during the LBA crisis (Fig. 1). Data from Hala Sultan Tekke were from Gibala-Tell Tweini, a thriving trade center located on the coast of the Ugarit kingdom. The radiocarbon (<sup>14</sup>C) date for the LBA crisis and the Sea People raid. Cyprus and Syria had a crisis before the Sea People event. They now meet through a common climate story to

ersified agro-production, pastoral activities, and sustained a cultural revival during this

t an ecological-climate influence on past societal shifts. The climate proxies from Hala [11]–[12] firmly link the island and the mainland through their comparable climatic LDC, tested by LDCC, are significantly correlated with the highest correlation coefficient both proxies reveal a hydrological anomaly for the 1200–850 cal yr BC period, drought event, recorded both on the island and on the continent. The onset of the drought is the LBA crisis and the Sea People event.

te and agricultural productivity from Gibala-Tell Tweini, Northwest Syria.

l proxies are plotted against time (1500–500 cal. BC). Radiocarbon dates for the red stars. The time-window of the invasions at the Bronze-Iron Age boundary is destruction layer (blue). At the top, the cross-correlogram shows the correlation between the availability from Hala Sultan Tekke and that from Gibala-Tell Tweini. Vertical and horizontal axes show the lag (1 unit=1 sample). Significance level  $P=0.05$ . [04.g006](#)

structions led by a flow of migrants, the Sea Peoples, is clearly attested in Cyprus with the Late Cypriot IIC-IIIa transition dated to 1220–1190 cal yr BC [76]–[77]. Late Cypriot pottery found at Gibala-Tell Tweini (Fig. 6), in the destruction layer dated from the end of the Bronze Age located on the coast of the ancient Ugarit kingdom, where large-scale excavations unearthed a well-preserved destruction layer coeval with the end of the Bronze Age world. [2] has given the first chronology for the Sea People raids with a pooled mean age dated to 1  $\sigma$  at 1215–1190 cal yr BC. This  $^{14}\text{C}$  calibration range is identical to the Late Cypriot IIC-IIIa transition. A firm chronological link between these events. At the same time, evidence of a long-term drought and subsequent food shortages after 2970 $\pm$ 40  $^{14}\text{C}$  yr BP [11]–[12] derive from a pollen record at Tell Tweini (Fig. 6). The LDCC has revealed that this long-term dry period marked by the LBA crisis is identified in Cyprus, at Hala Sultan Tekke (Fig. 3). The congruence of drought-impacted agriculture in the Mediterranean is confirmed by textual evidence [12], but the human-environmental

in Cyprus and Syria) were dated by radiocarbon chronology, we choose an objective Bayesian fit. The first date for the climate event and the fall of crop yields in Syria (core dated in a matrix of radiocarbon data obtained from the destruction debris (Fig. 6). The two dates are statistically the same at the 95% confidence level using a  $T=0.002 < 3.84$ ). The weighted average date (2963 $\pm$ 13  $^{14}\text{C}$  yr BP) gives a 1  $\sigma$  calibrated age range of 1180–1160 cal yr BC with 24.3% relative probability and another age range of 1180–1160 cal yr BC with 26.3% relative probability [78] and Oxcal 4.1 [78] with IntCal09. The weighted average date previously obtained for the LBA crisis is a pooled mean age of 2962 $\pm$ 14  $^{14}\text{C}$  yr BP, with a 1  $\sigma$  calibrated age range of 1215–1190 cal yr BC and another age range of 1180–1160 cal yr BC with 26% relative probability. The congruence of the two dates (2962 $\pm$ 14  $^{14}\text{C}$  yr BP) indicates that the two pooled mean ages are statistically the same at the 95% confidence level using a  $T=0.002 < 3.84$ ). The weighted average date obtained by combining the two dates with no changes in the calibrations. This indicates that the LBA crisis, the Sea People event and the drought are the same event.
